

What is claimed is:

1 1. A light projection apparatus comprising:
2 a light source adapted to project illumination along a light path;
3 dynamic patterning means interposed within the light path for forming a light pattern;
4 and
5 steering means within the light path for directing the light pattern in a desired one of a
6 plurality of controllable directions.

1 2. The apparatus of claim 1, wherein the light source includes a plurality of LEDs
2 of at least a first color and a second color adapted to provide light along the light path common
3 to said LEDs.

1 3. The apparatus of claim 2, wherein the plurality of LEDs includes a third color
2 adapted to provide light along a light path common to said LEDs.

1 4. The apparatus of claim 3, wherein the first color LED, second color LED and
2 third color LED are respectively a first primary color LED, a second primary color LED, and a
3 third primary color LED.

1 5. The apparatus of claim 2, further including intensity control means for
2 controlling the intensity of the first color and the second color of the plurality of LEDs
3 independently of one another.

1 6. The apparatus of claim 1, wherein the dynamic patterning means includes:
2 a transmissive LCD matrix interposed within the light path, said matrix comprised of a
3 plurality of pixels; and
4 means for selectively actuating the pixels to form a pattern, said pattern preventing light
5 received from said LEDs from continuing along said light path and through said pixels forming
6 said pattern to thereby form a light pattern inversely related to said pattern.

1 7. The apparatus of 6, further including memory means having a plurality of
2 different patterns stored therein.

1 8. The apparatus of claim 6, wherein said means for selectively actuating the pixels
2 includes means for addressing each pixel of the transmissive LCD matrix with two or more bits
3 of data so that each pixel is capable of passing a partial amount of light from the light source.

1 9. The apparatus of claim 8, wherein the transmissive LCD is a grayscale LCD.

1 10. The apparatus of claim 2 wherein the patterning means includes:
2 a wheel having a plurality of pattern windows formed along a periphery of the wheel;
3 and
4 a wheel axis on which the wheel is mounted for rotational movement around the axis to
5 thereby present one of the plurality of pattern windows within the light path.

1 11. The apparatus of claim 1, wherein the steering means includes a mirror having a
2 central axis at an oblique angle to the light path.

1 12. The apparatus of claim 11, further including means for tilting the mirror in a first
2 axis transverse to the mirror axis.

1 13. The apparatus of claim 12, further including means for tilting the mirror in a
2 second axis transverse to the mirror axis and the first axis.

1 14. A light projection apparatus comprising:
2 a plurality of LEDs of at least a first color and a second color adapted to provide light
3 along a light path common to said LEDs;
4 intensity control means for controlling the intensity of the first color and the second
5 color of the plurality of LEDs independently of one another;
6 a transmissive LCD matrix interposed within the light path, said matrix comprised of a
7 plurality of pixels;
8 means for selectively actuating the pixels to form a pattern, said pattern preventing light
9 received from said LEDs from continuing along said light path and through said pixels forming
10 said pattern to thereby form a light pattern inversely related to said pattern;
11 a mirror interposed within the light path to intercept said light pattern and having a
12 mirror axis at an oblique angle to said light path; and

13 steering means for changing the oblique angle of the mirror axis relative to said light
14 path.

15

1 15. The apparatus of claim 14, wherein the plurality of LEDs includes a third color
2 adapted to provide light along a light path common to said LEDs.

1 16. The apparatus of claim 15, wherein the first color LED, second color LED and
2 third color LED are respectively a first primary color LED, a second primary color LED, and a
3 third primary color LED.

1 17. The apparatus of claim 14, wherein said means for selectively actuating the
2 pixels includes memory means having a plurality of different patterns stored therein.

1 18. A method for projecting light onto a projection surface comprising:
2 directing light along a light path;
3 displaying a selected one of a plurality of patterns on a display device interposed within
4 the light path to form a light pattern;
5 reflecting the light pattern off of a mirror in a first direction;
6 moving the mirror; and
7 reflecting the light pattern off of the mirror in a second direction.

1 19. The method of claim 18, further including:
2 providing a plurality of LEDs capable of generating light along the light path of a first
3 primary color, a second primary color, and a third primary color; and
4 independently regulating the intensity of light output from the LEDs for each of the first,
5 second, and third primary colors to yield colored light.

1 20. The method of claim 18, wherein the step of moving the mirror includes:
2 tilting the mirror in a first mirror axis; and
3 tilting the mirror in a second mirror axis transverse to the first mirror axis.

1 21. The method of claim 20, wherein the step of moving the mirror further includes
2 rotating the mirror around a third mirror axis transverse to the first and second mirror axes.

1 22. The method of claim 18, wherein the step of displaying a selected one of a
2 plurality of patterns includes displaying a grayscale image on the display device.
